

Fold Here

Santa and his team of Elves open the file on Christmas Eve. With frantic pace and precision, they gather all of the presents and set off to deliver them.

Here is the code that reads the file, globalgoodies.txt.

Translate it into pseudocode. See if you can figure out how to use:

WHILE NOT EOF ("globalgoodies.txt") DO

```
def readFile( ):

    #f is type FILE
    #present, fileString are type STRING
    #colon in type INTEGER

    f = open("globalgoodies.txt", "r")

    for line in f:

        colon = line.index(":")

        present = line[colon+1:]

        print("Next order :", present)

    f.close()
```

Notes

Use the pseudocode built-in function INDEX to find the index of the colon ":".

INDEX(s : STRING, c: CHAR) , returns the index of c in s

Use the pseudocode built-in function END to get the present of the colon ":".

END(s : STRING, start: INTEGER) , returns a substring of s starting at index start.
