

searching for students

A computer program stores student data in a file, students.txt.

Each line of data has the name of a student followed by a score in the range 49-99 eg:

"Jessica Haswell_77"

is a sample line.

A function, getScore, takes a student name as a parameter and searches for the student in the file. If it finds the student it returns the score as an integer; otherwise it returns -1.

Write the pseudocode for the function getScore.

BUILT-IN FUNCTIONS

- RIGHT(s,n) returns a substring of length n from the right of string s.
- LEFT(s,n) returns a substring of length n from the left of string s.
- LENGTH(s) returns the length of string s.
- STRING_TO_NUM(s) returns s as an INTEGER

Fold Here

Note: In pseudocode, use & to concatenate strings together.
